FireShot Pro Installation in Firefox, Chrome, Internet Explorer, Seamonkey and Thunderbird

Please open your browser and type in the following link in the address bar and press Enter:

http://getfireshot.com/fireshot-install.exe

Download and save this installation file to disk. Please close all of your instances of Firefox, Internet Explorer, SeaMonkey and Thunderbird browsers and launch the downloaded file. The dialog appears and you can select the programs FireShot to be integrated into. After the selection performed, please click «Install».

S FireShot Pro v. 0.98.85 Setup	- 🗆	×
Please select the browsers/dients to integrate FireShot into:		
✓ Firefox		
Chrome		
✓ Internet Explorer		
Seamonkey		
 Thunderbird 		
✓ Opera		
Cancel Nullsoft Install System v2.46	Inst	all

When the installation is done, please run your browser.

Page 4 of 29

Depending on the previously installed version of FireShot, you might or might not be asked to allow FireShot to be integrated with your browser. Kindly accept the installation by checking the option shown below and click «Continue».

The dialog in Firefox:

follow	ing add-on:
	FireShot 0.98.6
	By Eugene G. Suslikov
	Location: C:\Users\evgeny\AppData\Roaming\Mozilla\Firefox\
You ca Manag	Allow this installation

						~
The	'FireShot' add-oi	n from 'E	evgeny Suslikov	' is ready for use.		×

You may be asked to restart your browser. Once the browser restarted you will be able to use your addon. Normally you should see the «S» button at the upper right corner of your browser.

Firefox browser:

Internet Explorer:

Page 6 of 29

Google Chrome:

FireShot provides new interface objects such as buttons and context menus and different customization options. Be sure to click on the **Options** button (if it has been enabled) in the Firefox Add-ons Manager, and also go to **View** > **Toolbars** > **Customize** to see if a new «S» button have been added.

Activating your Pro Version

FireShot is available in two versions: a simple and free one and a Pro version. Though the simple version typically suits 80% of usual user's needs, there's a Pro version that provides a rich set of advanced features:

- **Multi-editor interface.** You can switch between captures, use clipboard to exchange annotation objects.
- Uploading to Flickr, Google Picasa, ImageShack, EasyCaptures. Use these services to store your captures at image hosting engine.
- **Easily customized uploads to FTP and HTTP servers.** For example, you can automate the bug-tracking engine you're using, or simply store images at your server.
- **Organizing files into projects.** Everything can be stored as a project without anything being lost. You can reload it and continue your work exactly from the place you stopped previously.
- Saving and Loading graphic files. You can add comments to your photos by dragging and dropping them onto the Editor. The files will be opened automatically.
- Work with clipboard. Copy any bitmaps to your clipboard in your favorite editor or take a screenshot by pressing Print Screen and open it in FireShot in two clicks. Have a nice screenshot in Internet Explorer? Now you can easily transfer it to FireShot. With FireShot you can edit anything that can be copied to your clipboard!
- **Printing.** Browsers sometimes do not print documents exactly as you want them to. FireShot Pro will give you the exact printout you want.
- Custom bitmaps for watermarking.

You can give a try to the full Pro Version with a switch and use it for free in a 30 day period. The Pro Version features will be automatically turned off after the trial period runs out. This means that you will continue to use the program as free version. You can purchase the Pro key by following this link: http://getfireshot.com/buy.php.

© GetFireShot.com, 2016

Page 7 of 29

You can activate the Pro version in a few simple steps:

You'll need to switch to Pro mode if you haven't switched yet. To do this, please open the FireShot menu and select **«Switch to Pro!»**:

	Theshot	
		☆ S
✓ Capture all tabs and Edit	Ctrl+/	Alt+Shift+Z

Capturing webpage

Traditionally, there are several ways to capture the webpage. You can use the red «S» button located at the top right corner of your browser. Clicking on the button provides the default capturing method and action («Capture entire webpage and Edit»). Alternatively, you can specify the «Area» to be captured and a further action, by clicking the arrow located next to the red «S» button. You can also use the «Main Menu» or the «Context Menu». Finally, the group of icons located at the browser's right bottom corner can be used as well.

Page 11 of 29

You can capture different webpage areas by selecting one of the variants:

- Clicking «Capture visible Area and...» will grab only the visible part of the webpage.
- Clicking «Capture Selected area and...» will provide you with a selection instrument to specify the area to be captured:

- Clicking «**Capture entire Page and...**» grabs entire web page including the areas that you cannot see without scrolling.
- And clicking «Browser window and...» will capture the browser's window including its contents.

One of the great features of FireShot is the wide choice of the variants of processing the captured content!!

The content can be opened with the built-in Editor, quickly edited to fit to various social site rules and annotated and then can be:

- Uploaded to Picasa, Flickr, ImageShack, custom FTP or HTTP Server
- Saved to disk as PDF, PNG, GIF, JPEG, BMP
- Copied to clipboard
- Printed
- E-Mailed
- Exported to external editor

Page 12 of 29

Using the Editor

What makes FireShot a really powerful tool is the built-in Editor that provides a set of tools for editing and annotating the captured content quickly and efficiently.

The screenshot below shows how exactly the Editor window looks like:

The editor consists of the following sections:

- 1. Tools panel
- 2. Captures list
- 3. Object style editor
- 4. Hints panel
- 5. Editor's workspace module

The Tools panel contains the buttons providing fast access to the Editor's features. The buttons are grouped according to their functions:

- 1. **Upload**, **Save**, **Copy**, **Mail**, **Export** and **Print** buttons provide uploading, saving to disk, copying to clipboard, e-mailing, exporting to another Editor and printing functionalities.
- 2. **Open, Save** and **Save** as buttons are designed to work with projects. A project is a file containing a set of captures.
- 3. Undo and Redo buttons.
- 4. Select button switches Editor's mode to selection either the object or the area.
- 5. Shape, Drawing, Pointer, Text and Image buttons provides access to fast annotation objects creation.
- 6. **Options** and **About** buttons.

Page 13 of 29

The **Captures list** holds all the captured web pages. You can switch between the captures by selecting the thumbnails in the Captures list.

The **Object style editor** provides fast access to the various properties of the annotation objects. It is possible to specify an object structure, colors, size of the font and many other visual properties.

The **Hints panel** contains various useful hints. You can close this panel by clicking at the «x» button located at the right of the panel.

The Editor's workspace holds the captured contents and performs various operations with it.

Editing your capture

FireShot is one of the best tools to quickly add annotations (shapes) and perform quick corrections (bitmap tools) to the captured web pages.

Shapes

Various shapes have been developed to quickly and effectively annotate captured screens. They're placed in a separate layer and can be modified or removed at any time.

To add a shape, press one of the buttons (Shape, Drawing, Pointer or Text) and create a selection with your mouse or touchpad at the Editor's workspace.

• **Text and Shape tool**: allows you to highlight the fragment using Rectangular or Elliptical shape and annotate it. This tool is useful when you want to apply annotation to the fragment of your capture and you want to specify the boundaries applied to your annotation.

Page 14 of 29

• **Text and Freeform Drawing tool**: allows you to create freeform drawings and attach text messages to them. It's useful when you want to create unique / custom made objects.

Page 15 of 29

when you have no ability to capture the screen immediately because some actions to be performed before the capturing.

• **Text and Line tool**: allows creating a pointer with text description. It is useful when you want to quickly point at something.

© GetFireShot.com, 2016

Page 16 of 29

• **Text tool**: provides a text box for simple annotation. It is useful when you want to simply leave a comment.

some actions to be performed before the capturing.

Page 17 of 29

Bitmap tools

What if you need to hide some content from the capture or apply an artistic effect to some areas at the captured content? The solution is to use the bitmap tools available at the right side panel: when you create a simple selection using the Pointer tool:

S FireShot Pro capture #766 - 'Google' - www_google_ru

Hint: You can set up a template to create the names of your captures by default.	

Page 18 of 29

Graphical tools that work with selections

Crop tool: cuts off everything that is outside of the selection. This tool is useful when you want to exclude something from your screenshot.

Fill tool: fills the selected area with specified color. You may use «Color Picker» to select a color from the captured screen. This tool is useful when you want to totally exclude something from your screenshot.

Page 19 of 29

when you have no ability to capture the screen immediately because some actions to be performed before the capturing.

Page 26 of 29

Saving your captures

All the stuff described earlier would be useless if FireShot wouldn't be able to store the edited content. Happily, it does more than simply saving files to disk in PDF, PNG, JPG, GIF or BMP formats.

Upload button provides the access to the upload dialog:

S Upload images		×
✗ Image hosting services	Upload to EasyCaptures.com	(1 image selected)
easyCaptures	EasyCaptures Authorization If correct user name and password specified, the uploaded image will be added to the list of pictures for this user.	
flickr	Upload images anonymously (you won't be able to delete them after upload) Decistor pow	
Flickr	User:	
O Picasa"	Password:	
Picasa	Specify additional information	
200	Title:	
ImageShack	Description:	
✗ Custom web resources		*
	Tags (a space-separated list of tags to apply to the image):	
Custom HTTP	Share with: Only you	
$\overline{\mathbf{a}}$	Anyone But hide it from public galleries (it's invisible for others)	
Custom FTP	Save settings to file	
	Setup image type and size Setup proxy settings	Upload Cancel

You can choose whether the upload should be performed to **EasyCaptures**, **Flickr**, **Picasa** or **ImageShack** services or setup a **custom HTTP** or **FTP** server.

Some services like **Flickr** and **Picasa** will require an authorization to be performed before you start the uploading process, some services like **EasyCaptures** go smoothly as to «out-of-the-box» idea.

You can specify additional information like **Title**, **Description** or **Tags** to be sent along with the captured content. Additionally an image type or size and proxy settings can be set up using the buttons at the bottom panel of the dialog.

The Save button opens a dialog that will set up some parameters used while saving your captures.

It's possible to specify whether FireShot should ask for the **Destination folder** each time when the captures are being saved or, should the captured screenshot be stored at one location. A **Document type** (PDF, PNG, JPG, GIF or BMP) can be specified. If you choose JPG extension, the **JPEG compression quality** parameter can be altered as well.

Advanced options include packing of the captures into **ZIP archive** and **Image concatenation** feature. If the **image concatenation** feature is checked, every captured screenshot will be drawn to one canvas and saved as one image file. It's possible to specify whether the captures are arranged vertically or horizontally and if arrows are inserted between the images.

This dialog can be skipped when you press the **Save** button in the Editor window. To do this, please, check the **«Display this dialog only when Shift is pressed**» checkbox before pressing the Save button in this dialog. In that case, hold the Shift button down each time you want this dialog to be displayed.

The **Copy** button places your capture into Clipboard buffer.
